Solar oil distillate treated with 18% fuming sulfuric acid (without, however, completely removing the unsaturated) and washed to complete elimination of alkaline salts underwent a more extensive oxidation in the presence of manganese naphthenate than in the presence of naphthenates of zinc, lead and copper under identical conditions. Catalysis, Alkylation, Lead, Iron, Zinc, Acids,
Sulfuric acid, Cobalt catalysts.

Experiments of oxidation of vaseline oil and solar oil in
the presence of various catalysts are compared with
several non-catalytic experiments. Lead brought about
a more vigorous oxidation than iron or zinc at temper-
atures above 250°. Solar oil is much more stable
toward oxidation than vaseline oil and this is explained
by the presence in the former of resinous substances
